# Endometriosis Influencers on Instagram: Who are they and what are they posting?

Shiplo G, Gholifor M, Sarin N, Leonardi M

Department of Obstetrics and Gynecology, McMaster University, Hamilton, Ontario, Canada

**BACKGROUND**

- Endometriosis affects 10% of women and those assigned female at birth aged 15 to 44 years old\(^1\).
- Symptoms are painful menses, pelvic pain and subfertility.
- Endometriosis is a chronic inflammatory condition fraught with diagnostic and therapeutic challenges.
- Consequently, patients with endometriosis have turned to social media for health information and expression of their disease.
- Literature demonstrates the benefit of social media in improving patient health knowledge, communication and empowerment\(^2\).
- Instagram is a popular social media platform with 1 billion active users\(^3\).
- Instagram allows its users to post photos with captions to a public audience and search relevant content through hashtags and likes.

**OBJECTIVE**

To examine endometriosis-related hashtags and accounts on Instagram including the authors of the posts and what common themes, tones, and emotions emerge from the content being posted.

**METHODS**

30 Endometriosis-associated #s were searched on Instagram

- A list of 10 terms associated with endometriosis were searched under accounts on Instagram
- Top 20 and 10 most recent posts were examined
- First 30 accounts were examined

**RESULTS**

<table>
<thead>
<tr>
<th>Table 2: Author of posts and activity level</th>
<th>Hashtags % (n)</th>
<th>Accounts % (n)</th>
<th># posts in June (mean)</th>
<th># of likes per post in June (mean)</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

**CONCLUSIONS**

- From our results, there is a greater prevalence of patients posting on Instagram about endometriosis which is similar to other studies\(^4\).
- Most of the posts are patients providing social support and telling their stories about their experience with endometriosis in a personal narrative.
- Most commonly the posts conveyed a negative tone and portrayed sadness, which is not surprising because endometriosis is a chronic pain syndrome.
- For the most part the information on Instagram is generally accurate when compared to evidence based information, however, accuracy is likely to increase with more healthcare providers were posting on Instagram about endometriosis.
- Although there are fewer healthcare providers on Instagram about endometriosis which is similar to other studies, they are active users and obtain more likes on average compared to patients speaking to the potential reach Instagram has to a wide audience of patients.
